

ReportViewer Questions: How do I bind a report to a datasource during runtime in code.

Assuming you have already designed the report and have defined a data source (you can use the report wizard if not), it's just a matter of setting this datasource in the code.

For example, in the PageLoad of an .aspx page that has a reportviewer control on it (pointed to your report):

```
reportViewer1.LocalReport.DataSources[0].Value = <your data>;  
reportViewer1.RefreshReport();
```
